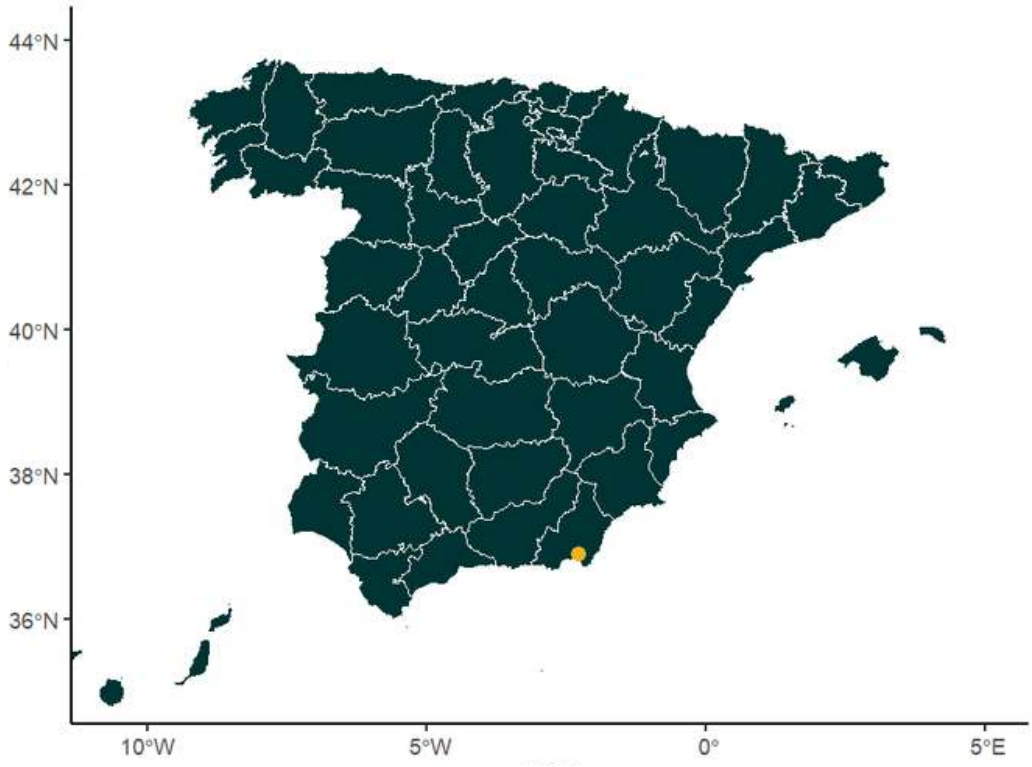
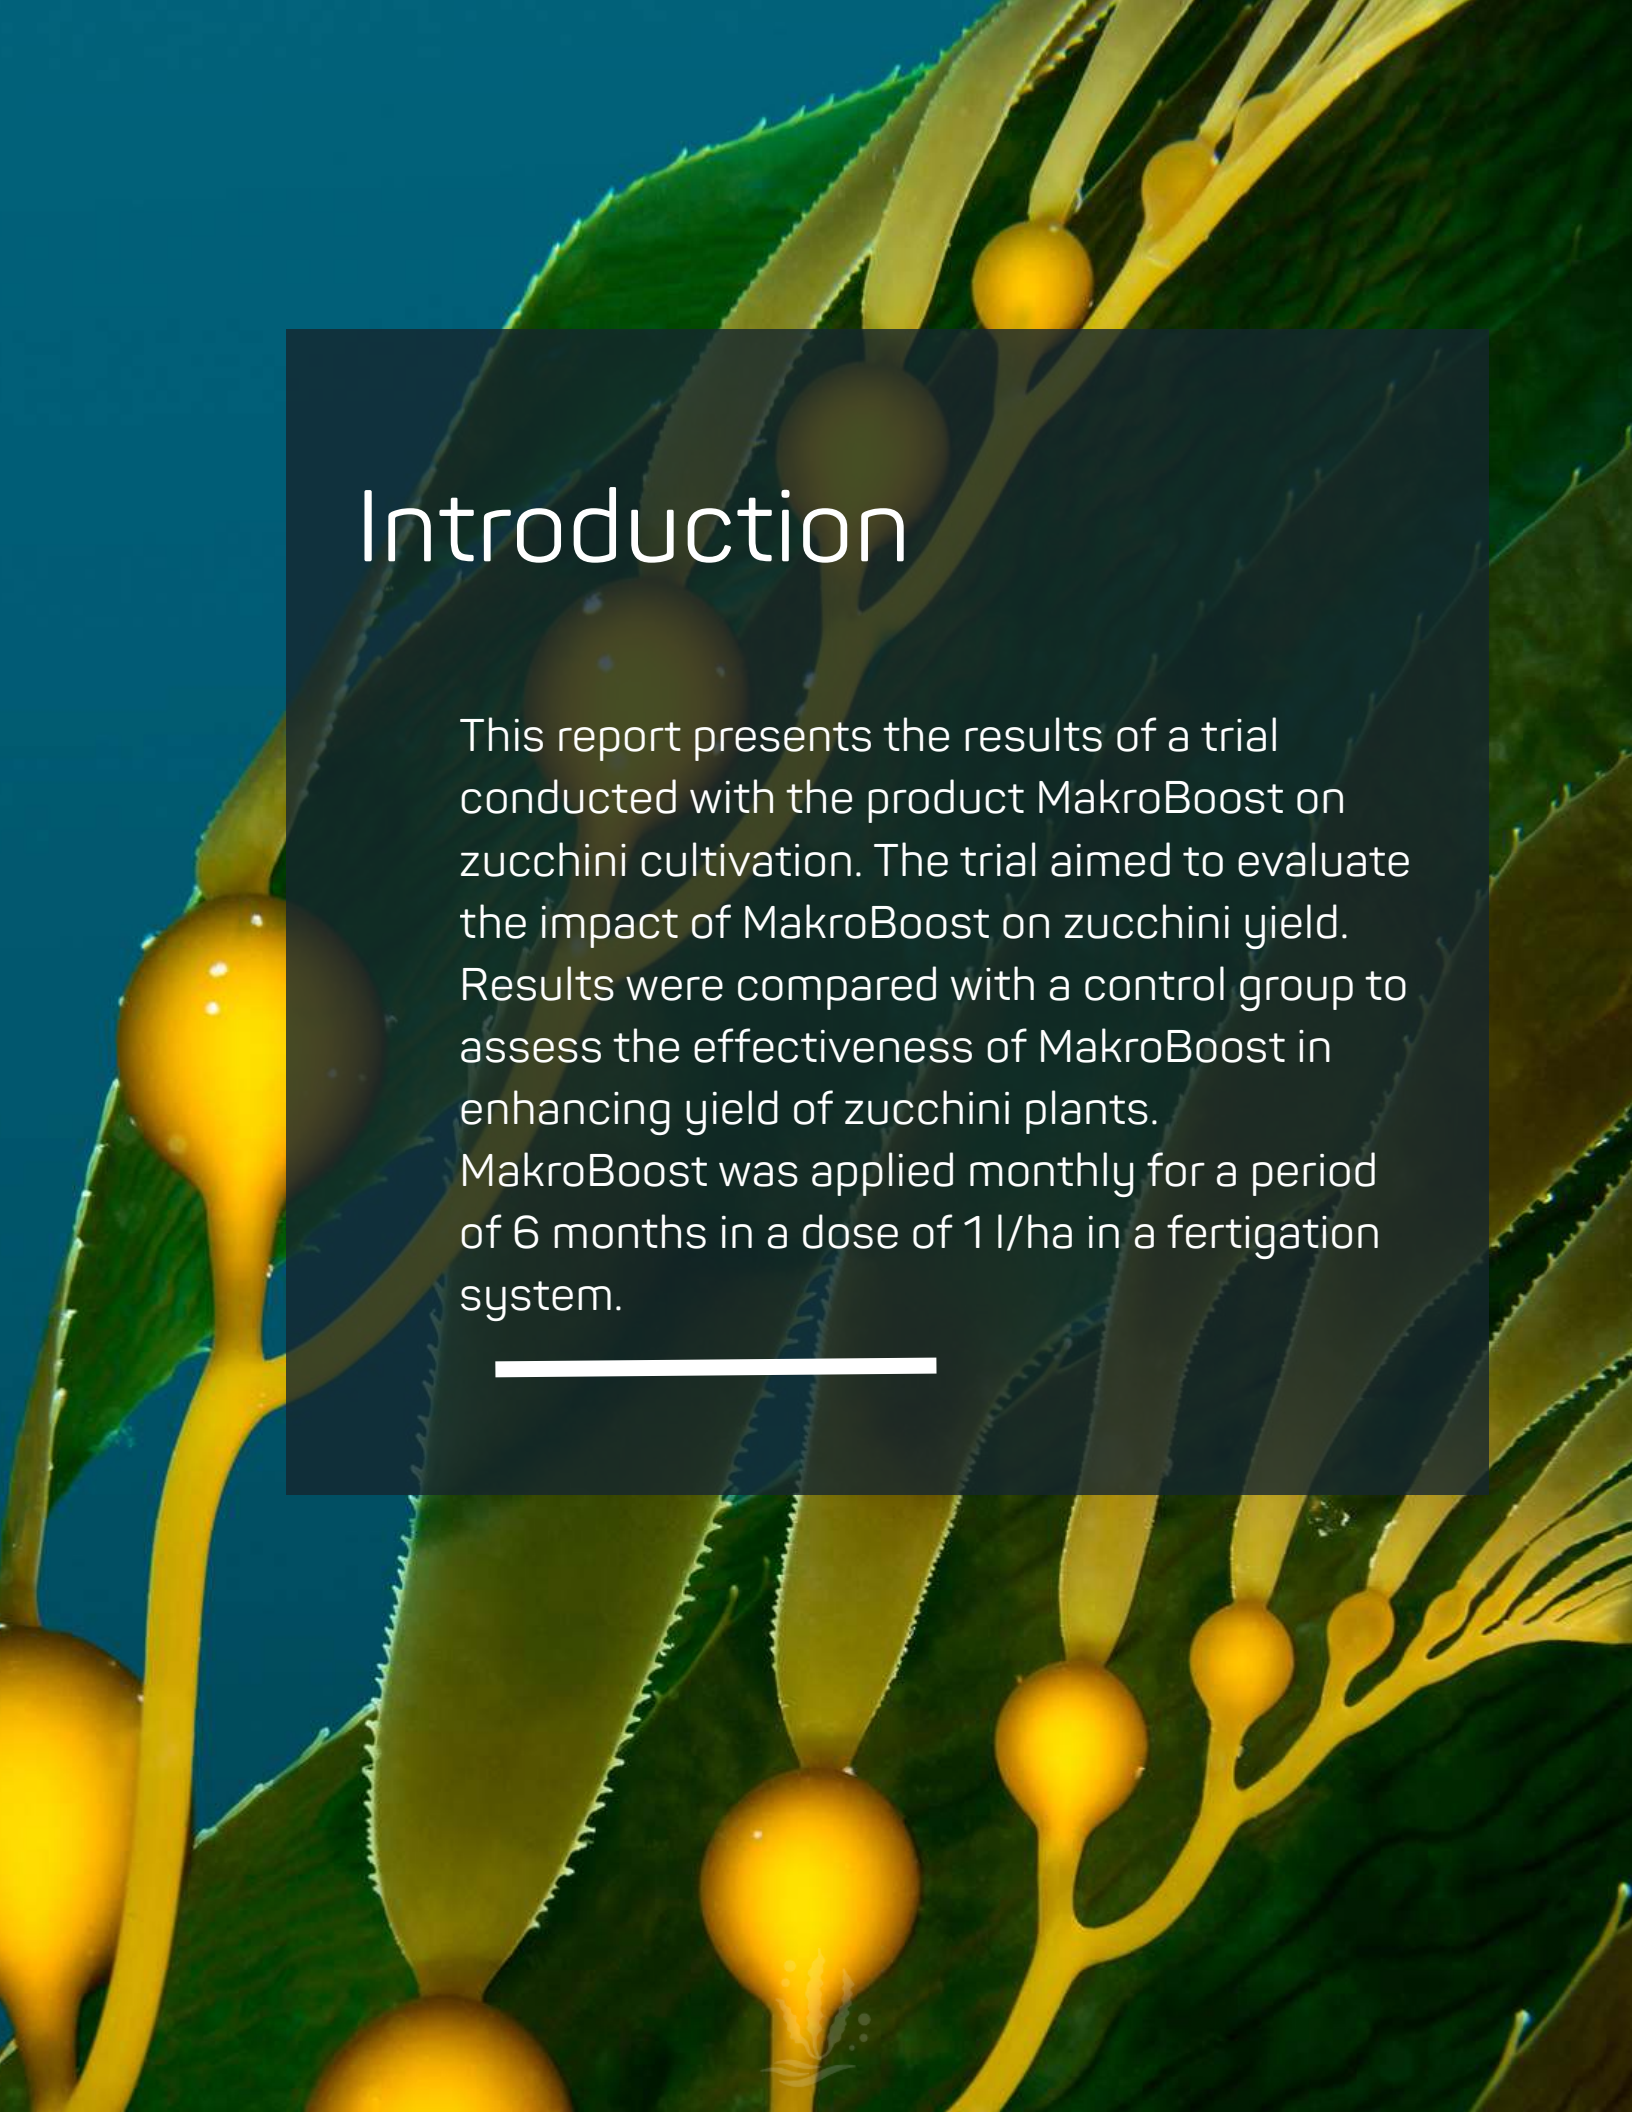
Field Trial Overview

Product: MakroBoost
Crop: Zucchini
Season: 2020
Objective: Evaluate the effect of MakroBoost on zucchini production

Location: Almeria, Spain



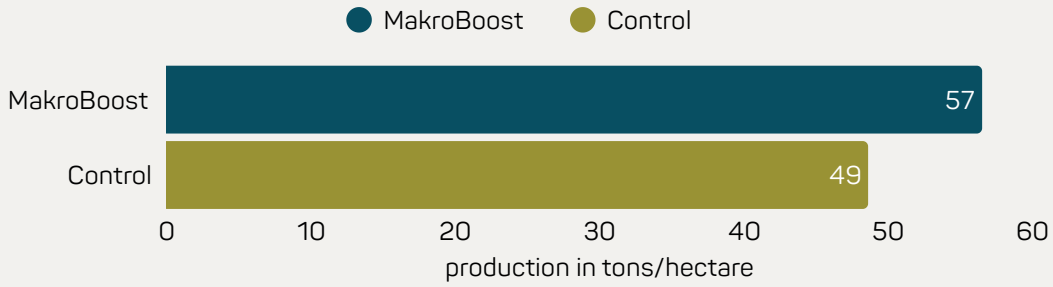


Introduction

This report presents the results of a trial conducted with the product MakroBoost on zucchini cultivation. The trial aimed to evaluate the impact of MakroBoost on zucchini yield. Results were compared with a control group to assess the effectiveness of MakroBoost in enhancing yield of zucchini plants.
MakroBoost was applied monthly for a period of 6 months in a dose of 1 l/ha in a fertigation system.

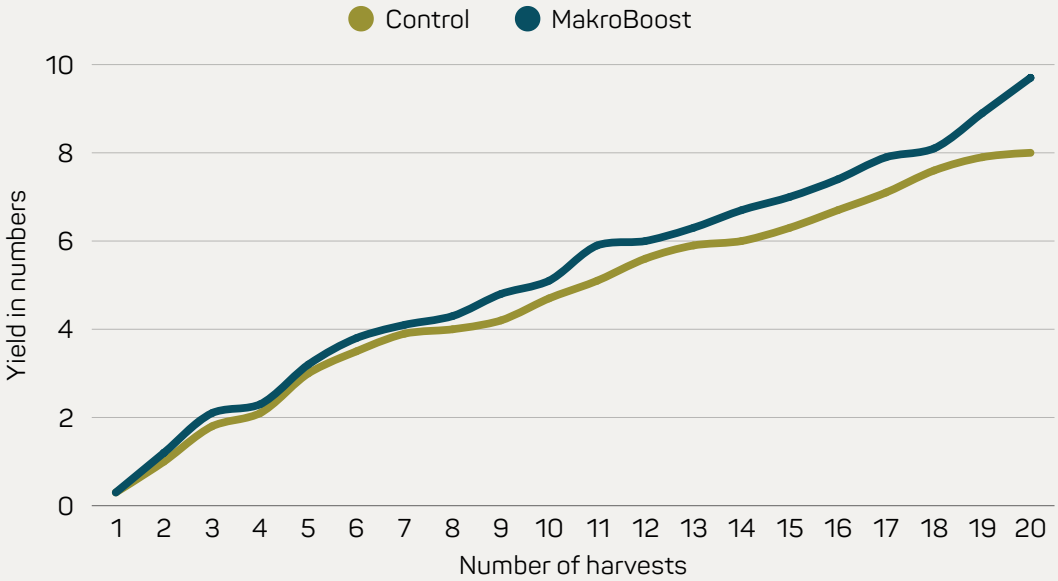
Results

Yield in Tons



MakroBoost enhanced yield by 16% compared to the control.

Yield in number of Plants



MakroBoost increased the number of zucchinis produced over time.

Recommendations:

The recommended monthly dose for zucchini cultivation is 1l/ha of MakroBoost. MakroBoost can be diluted and used during irrigation.

MakroBoost increased the number of zucchinis produced over time, improving yield by 16%.

Disclaimer:
MakroBoost has been sold in the Mexican market under the name Seaweed since 2005.
